Company history/background

Experienced in lifting technology.

The company in question boasts extensive experience in lifting technology and engineering, including in the “crane world”.

The taller the wind turbine, the greater the yield.

The energy yield of wind turbines depends, among other things, on the height of the wind turbine. In addition, the diameter of the rotor is important. At greater heights, there is wind more frequently (more stable) and the wind force is also greater. An additional advantage is therefore that wind turbines at higher heights generate so much more energy that fewer wind turbines need to be installed at specific locations. Currently, the ideal desired heights (above 220 meters) cannot be achieved worldwide due to the limited capacity of cranes. Even the very largest cranes, of which there are relatively few in the world, cannot reach high enough. Business partners sought. The capital sought is secondary to the quality of the business partners this company is looking for. Participation in the equity stake is negotiable and possible starting from 100,000 euros.

Unique selling points

New lifting technology.

The innovative lifting technology developed by this company enables the market to install large wind turbines (20 MW and larger) on land and at sea at great heights (above 280 meters hub height) in substantially less time and with less effort. The new technology has been tested with market parties. They confirm the capabilities of the new technique.

Other
