### Company history/background

Heat supply, soil improver, nutrition (feed / food) and energy (electricity)

The company concerned develops, operates, and leases breeding units (insects), based on the processing of validated combinations of organic residual streams, which are always sourced and processed locally.

Residual streams from market gardeners, farmers, and other food producers

Operational breeding units:

- supply heat back to the suppliers of residual streams (and thereby significantly reduce the annual CO2 emissions of the parties concerned),
- provide new insights into optimizing insect feed (professionalization of insect farms),
- produce a suitable soil conditioner that can be easily applied in agriculture, horticulture, and the private market,
- generate high-quality protein-rich food (meat substitutes) primarily for animals (animal feed) and, at a later stage, also for human consumption,
- generate energy (electricity) and allow excess energy to flow back into the producer of the residual streams.

## Unique selling points

Capital for rollout in the Netherlands

An extensive and relevant network has been built and various subsidies have been secured.

The company is on the verge of a rollout in the Netherlands.

Preferably, the cultivation units are delivered via a recurring revenue model (subscription models), which requires an initial investment each time.

## Other

Involved investors

The company is seeking actively participating investors with a background and experience in relevant sectors.

Participation is possible from 100,000 euros.
